Abstract

A branch of medicine that applies the principles and knowledge of the medical sciences to problems in the field of forensics (medical legal). It investigates and determines cause and manner of death. In modern era, it is possible to compare traces of blood, saliva, or any biological sample left at the crime scene with those found on a suspect's clothes and with samples from the victim. Their role proves its significance in cases that have to do with civil, family, and criminal law, as well as in cases of catastrophes with numerous victims (accidents, natural disasters, terrorist attacks, and wars).
